
Finding minimum subarray

It is a modified version of Kadane's algo:

```
cur_min = 0
global_min = int.max

for num in nums:
    cur_min += num
    if cur_min < global_min:
        global_min = cur_min
    if cur_min > 0:
        cur_min = 0

return global_min
```
